niram-css v0.2.0

The `niram-css` package lets you use standard CSS color names directly in your Typst documents. The word *niram* (நிறம்) means "color" in Tamil.

Typst ships with eighteen predefined colors; reaching for anything else means tracking down the exact Hex or RGB value. `niram-css` removes that step by exposing all 147 standardized CSS color keywords as named values.

Instead of pausing to look up `#6495ed`, just write `cornflowerblue`.

Key features:

- **Complete CSS Color Support:** Access all 147 standard color keywords from the CSS3 specification (see Table 1, or view them in a browser).
- **Flexible Naming Convention:** Write color names in the format most natural to you. Inputs are automatically normalized, meaning `cornflowerblue`, `cornflower blue`, `cornflower-blue`, `cornflower_blue`, and `CornflowerBlue` all resolve to the exact same color.

Requirements

This package requires Typst 0.13.0 or higher.

Getting Started

Import the package at the top of your Typst document:

```
#import "@preview/niram-css:0.2.0": *
```

Then, use the `css` function anywhere a color value is expected:

```
Normal text may be #text(fill: css("crimson"))[colored so.]
```

Normal text may be colored so.

That is all it takes to start using CSS color names in your document.

Usage

Function Reference

```
css(color-name: str) -> color
```

color-name `str`

A string representing the color name. The following conventions are all accepted and normalized to a canonical form before lookup:

Style	Example	Common in
No separator	`cornflowerblue`	CSS/SVG
`Spaces`	`cornflower blue`	X11/GIMP/Matplotlib
`Hyphens`	`cornflower-blue`	CSS tooling/LaTeX xcolor
`Underscores`	`cornflower_blue`	X11 alternate/Python/R
`CamelCase`	`CornflowerBlue`	X11/.NET/Java

Color name matching is completely case-insensitive; `AliceBlue`, `aliceblue`, and `ALICEBLUE` are all treated identically.

-> `color`

The `css` function returns an RGB color. Because the returned value is a standard Typst color type, you can seamlessly modify it using any of Typst's built-in color functions, such as `lighten` or `darken`.

Examples

The examples below assume that `#import "@preview/niram-css:0.2.0": *` is at the top of the document.

1. Filling a rectangle with a CSS color.

```
#rect(width: 100%, height: auto, fill: css("darkorchid"))
```

2. CSS color names can be written in any supported format. Lowercase and CamelCase are shown here.

```
#grid(
  columns: 2,
  rows: 2,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [(a) saddlebrown],
  [#box(width: 30mm, height: 1em, fill: css("saddlebrown"))],
  [(b) SaddleBrown],
  [#box(width: 30mm, height: 1em, fill: css("SaddleBrown"))],
)
```

(a) saddlebrown

(b) SaddleBrown

3. Typst's built-in `maroon` has a different hex value than the standard CSS `maroon`. To highlight this distinction, the CSS version in the example below uses an initial uppercase letter (`Maroon`).

```
#grid(
  columns: 3,
  rows: 2,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [Typst maroon],
  [#color.maroon.to-hex()],
  [#box(width: 30mm, height: 1em, fill: maroon)],
  [CSS maroon],
  [#css("Maroon").to-hex()],
  [#box(width: 30mm, height: 1em, fill: css("Maroon"))],
)
```

Typst maroon	#85144b	
CSS maroon	#800000	

4. Using CSS colors to underline and double-underline text.

```
Thin #underline(stroke: css("darkblue"), offset: 2pt)[underline.]

Double #underline(
  stroke: (paint: css("darkblue"), thickness: 0.5pt),
  offset: 2pt,
)[
  #underline(
    stroke: (paint: css("darkblue"), thickness: 0.5pt),
    offset: 5pt,
  )[underline.]
]

Thick #underline(stroke: (paint: css("darkblue"), thickness: 2pt), offset: 2pt)
[underline.]
```

Thin underline.

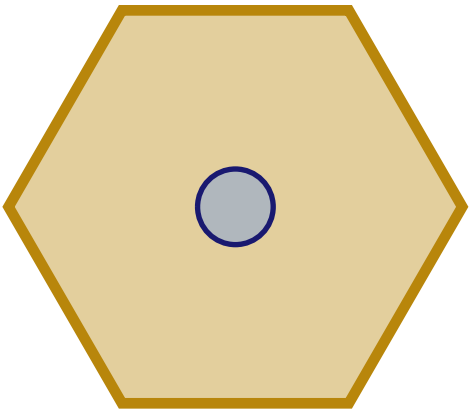
Double underline.

Thick underline.

5. Using CSS colors in drawing and data visualization.

```
#align(center)[
  #block[
    #polygon.regular(
      fill: css("darkgoldenrod").lighten(60%),
      stroke: (paint: css("darkgoldenrod"), thickness: 4pt),
      size: 60mm,
      vertices: 6,
    )
    #place(center + horizon)[
      #circle(
        radius: 5mm,
```

```
        stroke: (paint: css("midnightblue"), thickness: 2pt),
        fill: css("cornflowerblue").transparentize(60%),
      )
    ]
  ]
]
```



The History of the CSS Color Standard

X11 Colors

The X11 color names [1], developed in the 1980s, included a file named `rgb.txt` that was shipped with every X11 installation. It mapped over 400 color names to specific RGB values. This list was used in Unix-based systems to standardize color representation, but was never formally standardized across web formats, leading to variations between distributions.

Sixteen Named Colors

The HTML 3.2 specification [2] of 1996 introduced sixteen color names, derived from the standard sixteen colors supported by the Windows VGA palette. These colors, called the sixteen named colors, are:

- `aqua`
- `black`
- `blue`
- `fuchsia`
- `gray`
- `green`
- `lime`
- `maroon`
- `navy`
- `olive`
- `purple`
- `red`
- `silver`
- `teal`
- `white`

- `yellow`

Thanks to this standard, these sixteen color names could be used reliably and consistently in documents across the Web, without needing to specify hexadecimal values.

The CSS Level 1 colors introduced in 1996 specified these same sixteen colors, while the CSS Level 2 colors, introduced in 1998, expanded to seventeen colors with the addition of `orange`.

CSS/SVG Colors

Finally, the SVG 1.1 Specification of 2011 [3] and the CSS Color Module Level 3 [4] of 2022 standardized on a list of 147 color names, known as the "recognized color keyword names." They comprise the original HTML/VGA named colors, `orange`, and additional colors drawn from the X11 set.

This standardized list provides a consistent color naming scheme across the Web and has remained stable since its adoption. This set of color names forms the basis of this package. How the CSS colors were given their rather idiosyncratic names is explained in a factual but lighthearted fashion by Alex Sexton in this YouTube video [5].

While all 147 CSS color names are distinct, only 138 have unique hex values. The nine pairs of color names that share identical hex values are detailed in Table 2.

Typst's Predefined Colors versus CSS Colors

Typst ships with eighteen predefined colors, including the sixteen HTML named colors, `orange`, and one additional color, `eastern`, which has no CSS equivalent.

The remaining seventeen Typst colors share names with their CSS counterparts, but—with the exception of `white` and `black`—they have different hex values, as shown in Table 3.

X11 Gray Equivalents

X11 color coverage is intentionally out of scope for this package. The X11 database includes numbered color families (e.g. `red1–red4`, `blue1–blue4`, `gray0–gray100`) that are rarely used today.

However, any X11 numbered gray shade can be reproduced exactly with Typst's `lighten` function as demonstrated in Table 4.
