niram-css v0.2.0

The `niram-css` package lets you use standard CSS color names directly in your Typst documents. The word *niram* (நிறம்), pronounced /n̪ɪrʊm/, means "color" in Tamil.

Typst ships with eighteen predefined colors, which may be referenced by name. Using any other color entails tracking down its exact hex or RGB value. `niram-css` addresses this by making all 147 standardized CSS color names available within Typst. Instead of searching for `#6495ed`, just write `cornflowerblue`.

Key features:

- **Complete CSS Color Support:** Access all 147 standard color names from the CSS3 specification (see Table 1, or view them in a browser).
- **Flexible Naming Convention:** Write color names in the format most natural to you. Inputs are automatically normalized, meaning `cornflowerblue`, `cornflower blue`, `Cornflower Blue`, `cornflower-blue`, `cornflower_blue`, `cornflowerBlue`, `CornflowerBlue`, `CORNFLOWER_BLUE`, and `CORNFLOWERBLUE` will all resolve to the same color.

Requirements

This package requires Typst 0.13.0 or higher.

Getting Started

Import the package at the top of your Typst document:

```
#import "@preview/niram-css:0.2.0": *
```

Then, use the `css` function anywhere a color value is expected:

```
This is #text(fill: css("crimson"))[crimson] text.
```

This is crimson text.

That is all it takes to start using CSS color names in your document.

Usage

Function Reference

```
css(color-name: str) -> color
```

color-name `str`

A string representing the color name. The following conventions are all accepted and normalized to a canonical form before lookup:

Naming Convention	Example	Common in
lowercase	cornflowerblue	CSS / SVG
Spaces	cornflower blue	X11 / GIMP
Title Case	Cornflower Blue	UI Labels / Figma
kebab-case	cornflower-blue	SASS / Less / Tailwind
snake_case	cornflower_blue	Python / R
camelCase	cornflowerBlue	JavaScript / JSON / Swift
PascalCase	CornflowerBlue	X11 / .NET / LaTeX xcolor
SCREAMING_SNAKE_CASE	CORNFLOWER_BLUE	Bash / C constants
UPPERCASE	CORNFLOWERBLUE	JavaFX

`color`

The `css` function returns a native Typst color type, allowing you to apply built-in color functions like `lighten` or `darken`.

Examples

The examples below assume that `#import "@preview/niram-css:0.2.0": *` is at the top of the document.

1. Filling a rectangle with a CSS color.

```
#rect(width: 100%, height: auto, fill: css("darkorchid"))
```

2. CSS colors can be written in any supported format. Lowercase and PascalCase are shown here.

```
#grid(
  columns: 2,
  rows: 2,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [(a) saddlebrown],
  [#box(width: 30mm, height: 1em, fill: css("saddlebrown"))],
  [(b) SaddleBrown],
  [#box(width: 30mm, height: 1em, fill: css("SaddleBrown"))],
)
```

(a) saddlebrown

(b) SaddleBrown

3. Typst's built-in `maroon` has a different hex value from the standard CSS `maroon`.[1] The CSS version of `maroon` is invoked as a quoted string argument to the `css` function. The distinction between the two colors is demonstrated below.

```
#grid(
  columns: 3,
  rows: 2,
  row-gutter: 10pt,
  column-gutter: 10pt,
  [Typst maroon],
  [#color.maroon.to-hex()],
  [#box(width: 30mm, height: 1em, fill: maroon)],
  [CSS maroon],
  [#css("maroon").to-hex()],
  [#box(width: 30mm, height: 1em, fill: css("maroon"))],
)
```

Typst maroon	#85144b	
CSS maroon	#800000	

4. Using CSS colors to underline and double-underline text.

```
Thin #underline(stroke: css("darkblue"), offset: 2pt)[underline.]

Double #underline(
  stroke: (paint: css("darkblue"), thickness: 0.5pt),
  offset: 2pt,
)[
  #underline(
    stroke: (paint: css("darkblue"), thickness: 0.5pt),
    offset: 5pt,
  )[underline.]
]

Thick #underline(stroke: (paint: css("darkblue"), thickness: 2pt), offset: 2pt)
[underline.]
```

Thin underline.

Double underline.

Thick underline.

5. Using CSS colors for drawing shapes.

```
#align(center)[
  #block[
    #polygon.regular(
      fill: css("darkgoldenrod").lighten(60%),
      stroke: (paint: css("darkgoldenrod"), thickness: 4pt),
```

[1] See Table 4 for a full comparison of Typst's predefined colors and their CSS counterparts.

```
      size: 60mm,
      vertices: 6,
    )
    #place(center + horizon)[
      #circle(
        radius: 5mm,
        stroke: (paint: css("midnightblue"), thickness: 2pt),
        fill: css("cornflowerblue").transparentize(60%),
      )
    ]
  ]
]
```

The History of the CSS Color Standard

X11 Colors

The X11 color names [1], developed in the 1980s, were defined in a file named `rgb.txt` shipped with every X11 installation. It mapped over 400 color names to specific RGB values. This list became the de facto color naming convention on Unix-based systems, but was never formally specified by Xlib or the X11 protocol. Because `rgb.txt` was vendor-editable, different X server implementations shipped variations of the list.

Sixteen Names for the Early Web

The HTML 3.2 specification [2] of 1996 introduced sixteen color names, drawn from the Windows VGA palette. Known as the sixteen named colors, they are listed with their hex values in Table 2.

Thanks to this standard, these sixteen color names could be used consistently in documents across the Web, without needing to specify hex values.

CSS Level 1, introduced in 1996, adopted these same sixteen colors, while CSS Level 2 (1998) expanded to seventeen with the addition of `orange`.

CSS/SVG Colors

Finally, the SVG 1.1 specification of 2011 [3] and the CSS Color Module Level 3 [4] of 2022 standardized 147 color names, known as the "recognized color keyword names." They comprise the

original sixteen HTML/VGA named colors, `orange`, and an additional 130 color names drawn from the X11 set.

This standardized list — the basis for this package — provides a consistent color naming scheme across the Web and has remained stable since its adoption. Alex Sexton explains how the CSS colors got their idiosyncratic names in a factual but lighthearted YouTube talk [5].

All 147 CSS color names are distinct, but only 138 resolve to unique hex values. The nine alias pairs are listed in Table 3.

Same Name, Different Hex Value

Typst ships with eighteen predefined colors, including the sixteen HTML named colors, `orange`, and one additional color, `eastern`, which has no CSS color equivalent.

The remaining seventeen Typst colors share names with their CSS counterparts, but—except for `white` and `black`—they have different hex values, as shown in Table 4.

X11 Gray Equivalents

Full X11 color coverage is intentionally out of scope for this package. The X11 database includes numbered color families (e.g., `red1–red4`, `blue1–blue4`, `gray0–gray100`) that are rarely used today.

However, any X11 numbered gray shade can be reproduced exactly with Typst's `lighten` function, as demonstrated in Table 5.

CSS Named Color Reference

Table 1: All 147 CSS named colors and their hex values.

Color Name	Hex Value	Stripe
